JoinedUp Text Filter for Gimp 2.8 Help Sheet (Version 2.16)
Using Repeated Text

Repeated texts work along a path using any size values given. They can take a little while to work out before being placed on to a layer - especially with a long path. Words are spaced out evenly so that they fit the text to the path.

The first cool example shows the filter result using Sans Bold at size 200 without any repeat. The second shows the 'Repeat text along path' result with the same values entered. (Note that there is a space as the last character in the string of 12 text characters which are repeated.)

Using repeated text with Hair theme

The following examples use the same values with a text size step change value of -4 and then with jitter added at a range of 40.

Detail showing Papercut font with jitter set to 10 and with opacity at 75 – the filter was repeated a number of times along the same path
