

1-open an image,and add alfa channel

2-duplicate the image , make a selection on the duplicated image layer and cut it out (I have a colored layer between the two to show you better)

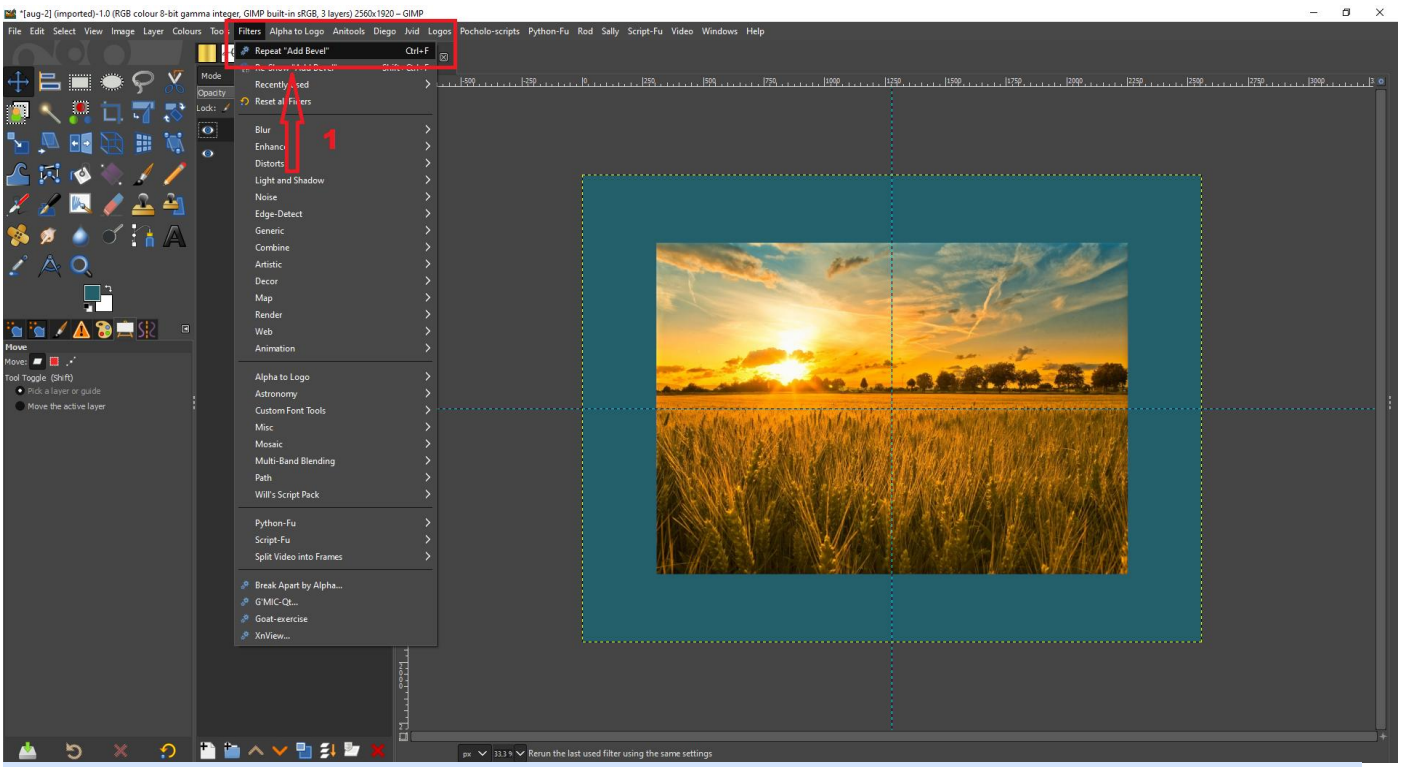

1- now go to filters- 2-decor - 3- add bevel

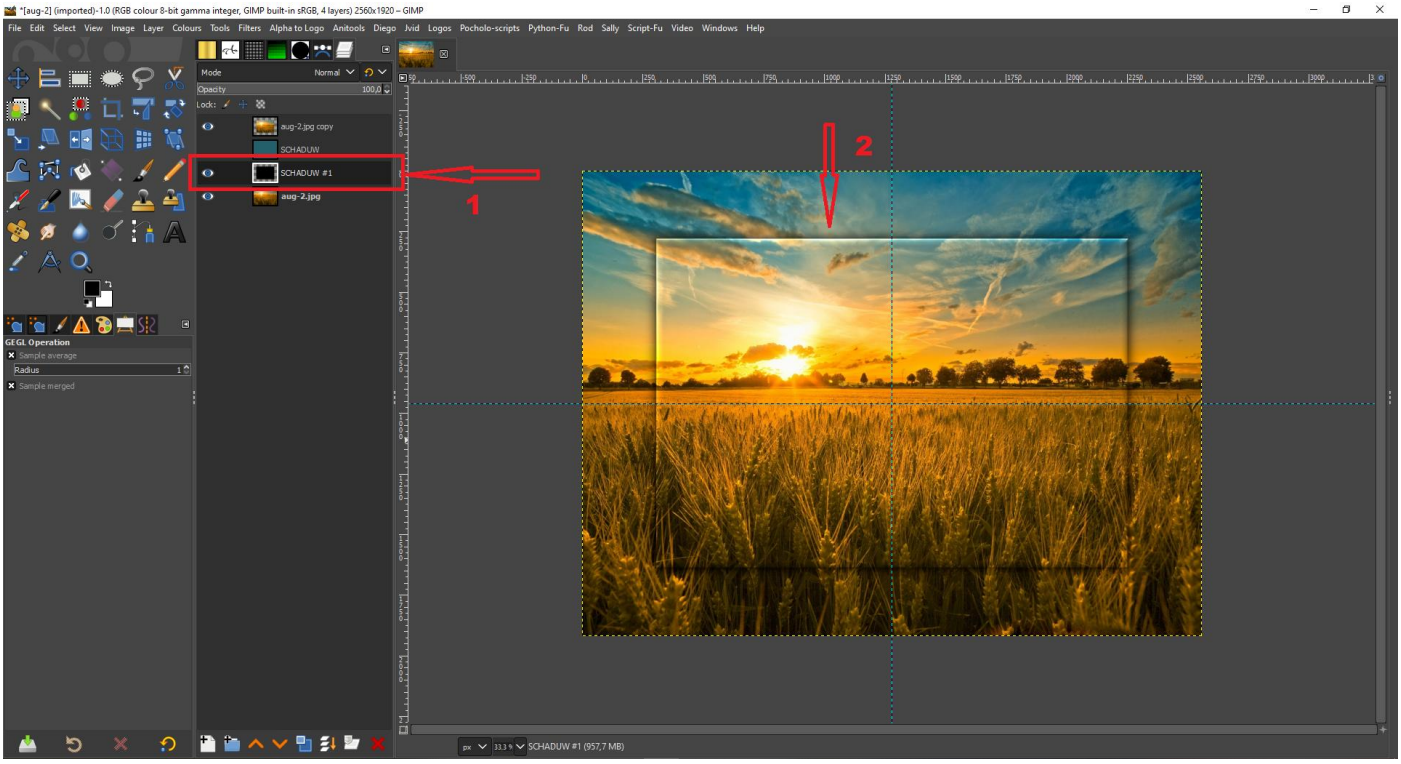

a window opens

1-slide the slider to the right (the further you move the slider, the wider the rounding )

2-remove the cross at work on kopy then klick ok

click on filters repeat add beveland repeat until you have a good roundness ( repeat 2x 3x )

now i make a shadow between the two images and get a nice result.

this is the simplest way,

you can also work with layer-layer effects – bevel and emboss

but you have to fill in the whole list

I hope you are on the right track with this, just give it a try
