

Custom Font Effects Only v0.11...

This is a simple plug-in to apply textures to custom font characters. The options can be applied individually or at the same time. The Emboss and Bumpmap operations provide options required by the relevant Gimp plug-ins to add flexibility and variety.

The bumpmap option requires the addition of a textured layer to the custom font file.

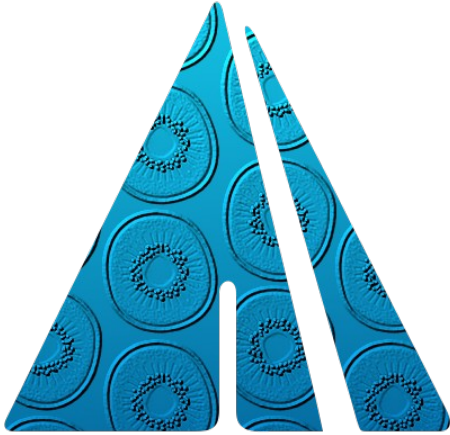

Use the artefact blur options to remove any unwanted artefacts from the bevel process.

The direction of the effects can be altered by changing the value of the 'Effect azimuth' option.

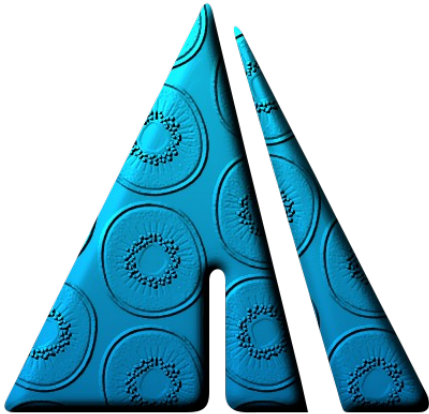

Earlier versions of the plug-in included a shine option but this has now been promoted to a separate custom font filter called Sheen N Shine.

Some examples...

A plain blue letter with a bumpmap added:

The bumpmapped character with an additional emboss applied:

And the same character with a bevel applied:
