

Straight pencil lines

I wanted to make some speed lines to show something was moving. I kept getting kinks in my lines when I clicked at one end, held down the Shift key and clicked to the other side or down. I kept playing with it and discovered while holding down the Shift key, if I pressed the Ctrl key *after* I had reached the point where I wanted the line to end but before clicking with the mouse, the Ctrl key straightened out the line with no kinks. This is for horizontal and vertical lines. I don't think you need it for diagonal or slanted lines.

This may be somewhere in the manual and I may be repeating information.

I'm going to number the steps because that's a lot of steps in one sentence.

1. Use the Pencil brush (you can also use the Paintbrush) and click where you want the line to start.
2. Press the Shift key and move the cursor to where you want the other end of the line.
3. Before you click the mouse button, while still holding down the Shift key, press the Ctrl key.
4. Click the mouse button.
